

Create a SharePoint list to receive windows autopilot update/upload status.

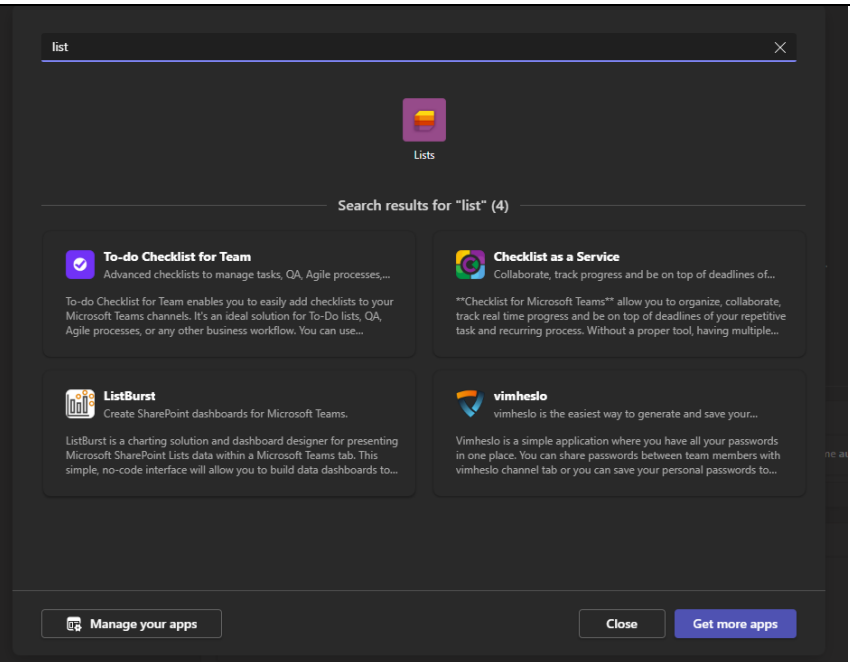

Summary

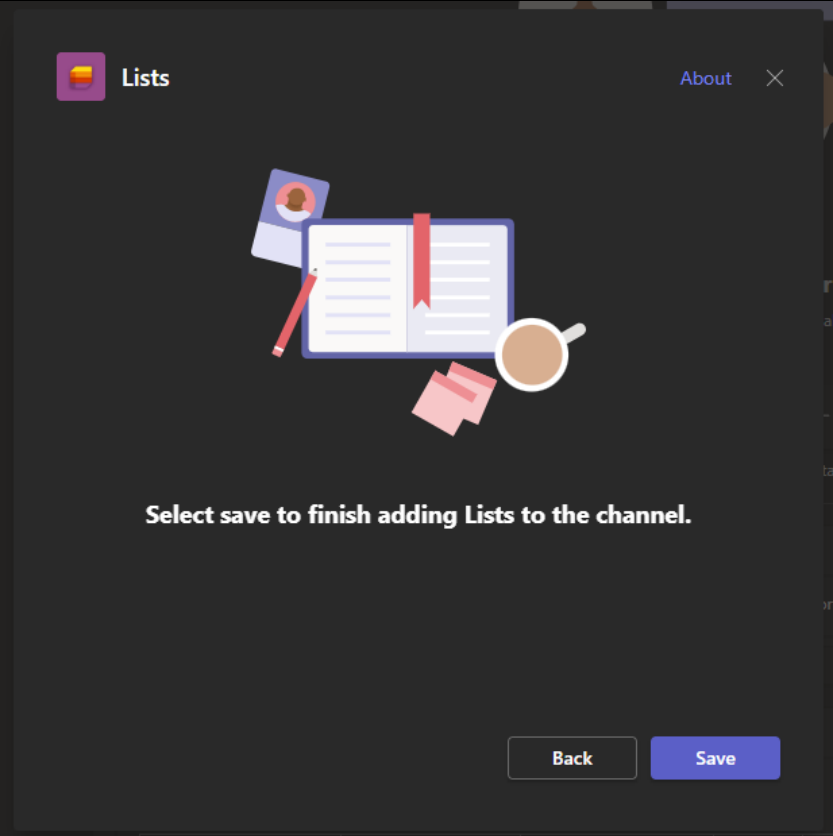

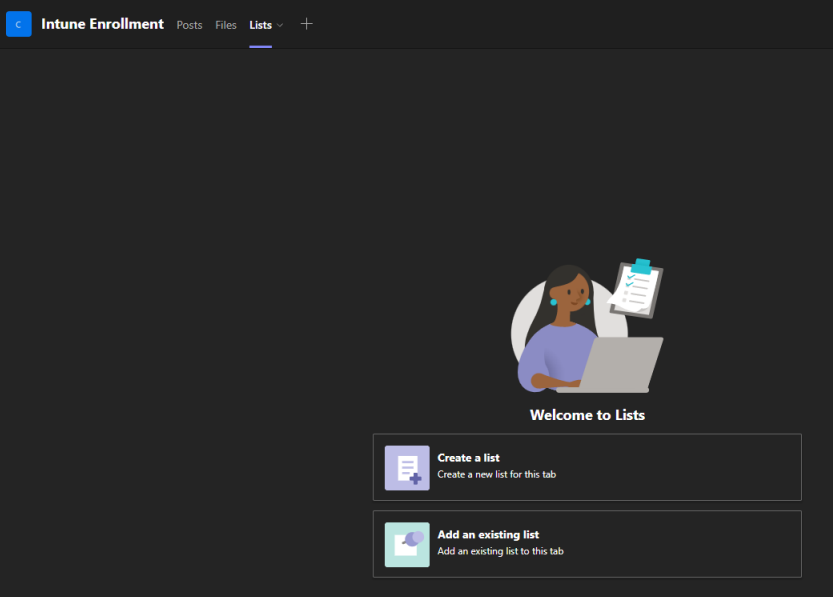

You can leverage SharePoint Online List (or simply Lists) to monitor/track windows autopilot device enrollment (hash import).

1. How to Create a List

- Create List using Teams Client (as long you can resolve/access the SharePoint site where the list is created)
- Create List connecting direct to SharePoint Site

Create List on Microsoft Teams Client

<p>Open your Microsoft Teams Client Go to your Team. Go to your Channel. Under the channel click the “+” icon Search for Lists or click “get more apps.”</p>	
--	---

<p>Click save</p>	
<p>On the next screen Click “create a list.”</p>	

Select "Blank List"

Search

Lists

Create a list

Blank list

From existing list

From Excel

Give it a **Name**:
Give it a **Description**:
Select **color**.
Select an **icon**.
Click **Create** to proceed

Lists

Meet

Create a list

Name *

Autopilot

Description

Autopilot hash import notification

Choose a color

Choose an icon

< Back

Create

Cancel

Your list is now created but empty.
Let's work on the columns we need

Intune Enrollment

Autopilot

Meet

+ New

Edit in grid view

Integrate

All items

Title

Add column

Add new item to create your list

Now add the following columns as follows.

LocationCode = **String** (in this scenario will always be EMPTY = Group Tag)

DateTime = **String** (from \$dt variable)

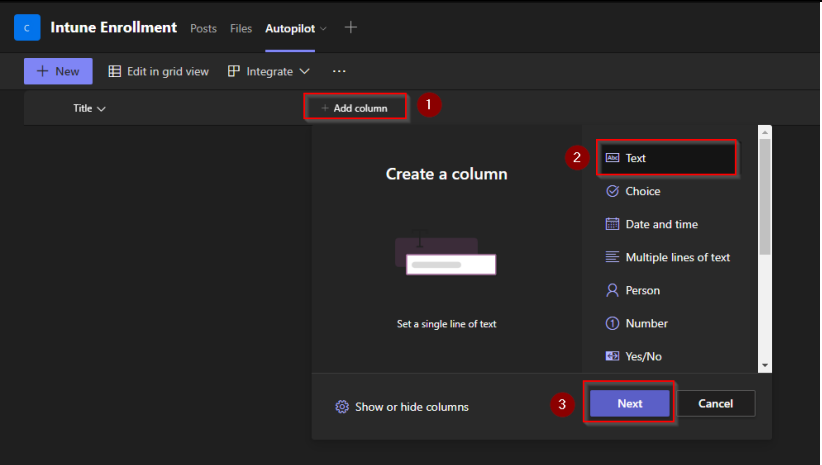

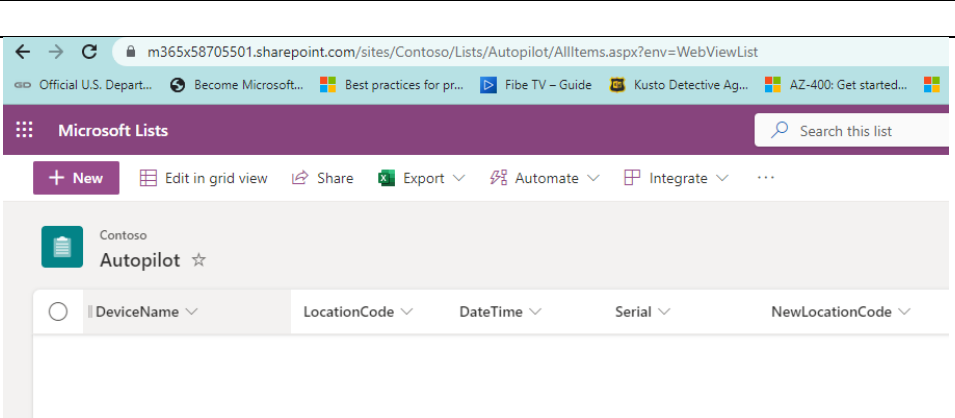

Serial = **String** (from \$serial variable)

NewLocationCode = **String** (in this scenario will always be EMPTY = Group Tag)

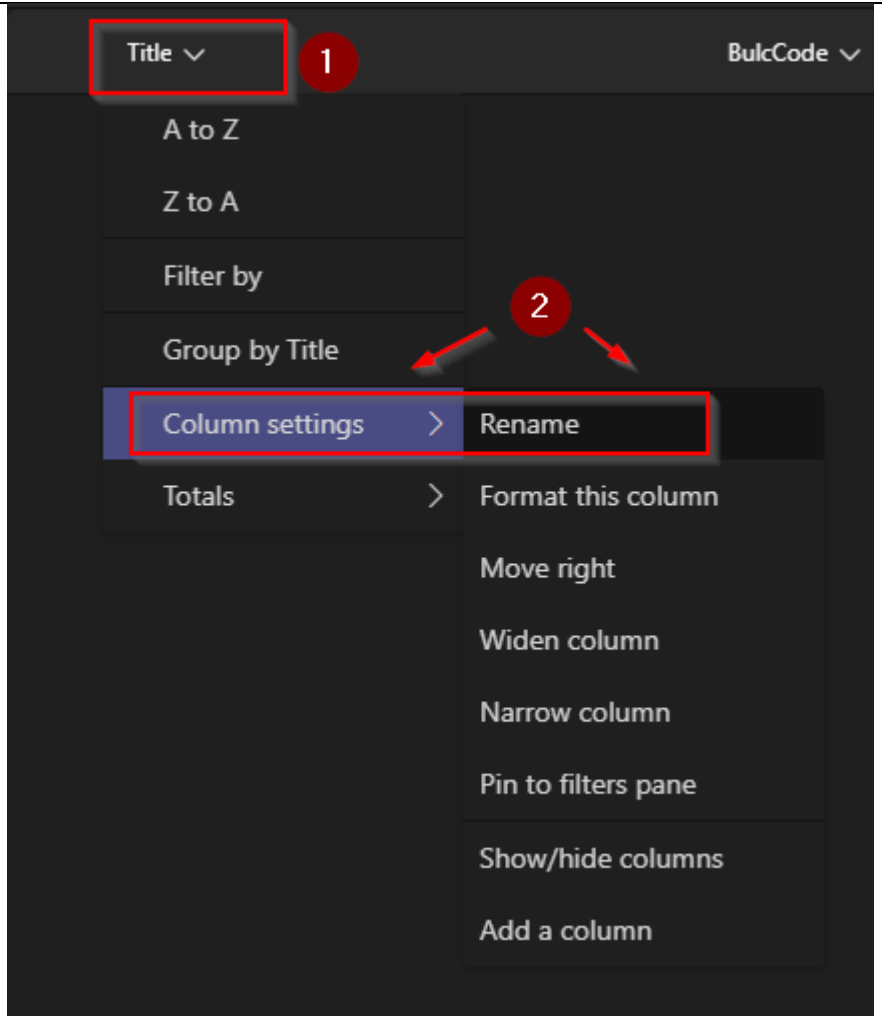

[Check Script here](#)

```
#upload values to SPT online list // List name: Autopilot (case sensitive)
Add-PnPListItem -List "Autopilot" -Values @{
    "Title"           = $env:COMPUTERNAME ;
    "LocationCode"    = $($temp.groupTag);
    "DateTime"        = $dt;
    "Serial"          = $serial;
    "NewLocationCode" = $groupTag;
}
```

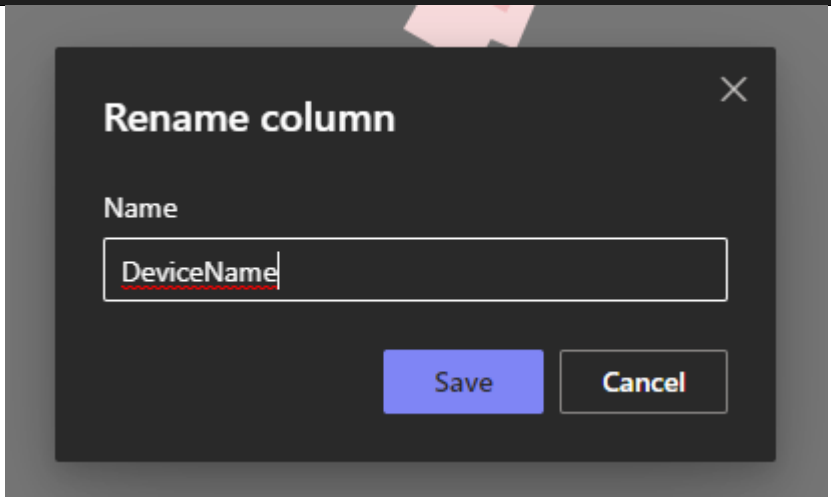

Where list name is "Autopilot" case sensitive

<p>Repeat the same steps for all 4 new Columns (type String)</p>	
<p>Create a column process (overview)</p> <p>Attention</p> <p>You now have new columns created.</p>	

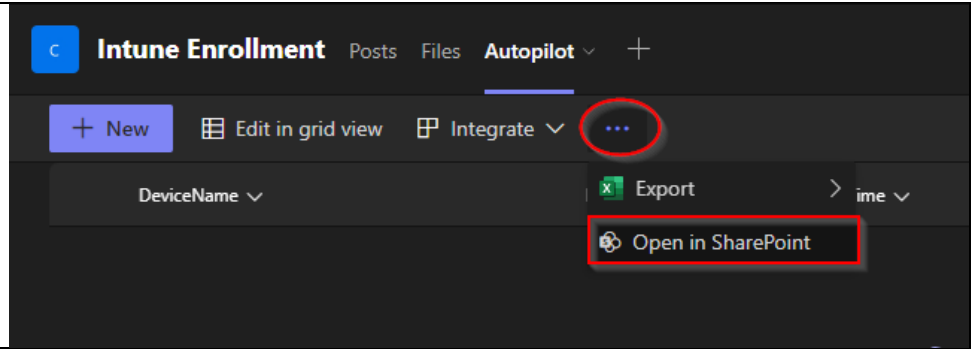

The **Title** is the default “column” for a list created you can rename it; however, it continues with the Title name in the PowerShell code otherwise that’ll fail.

In this scenario/environment I renamed to DeviceName

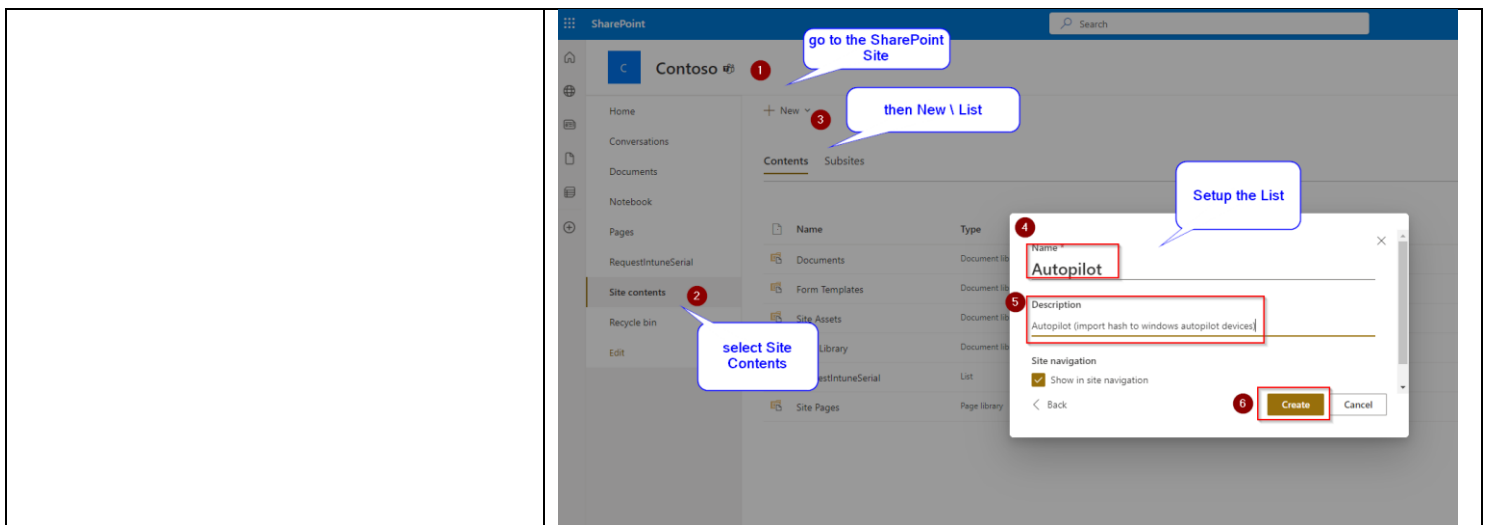

Go back to Teams client.
Expand ellipses (...)
Select Open in SharePoint
And **take notes** of the SharePoint Site URL

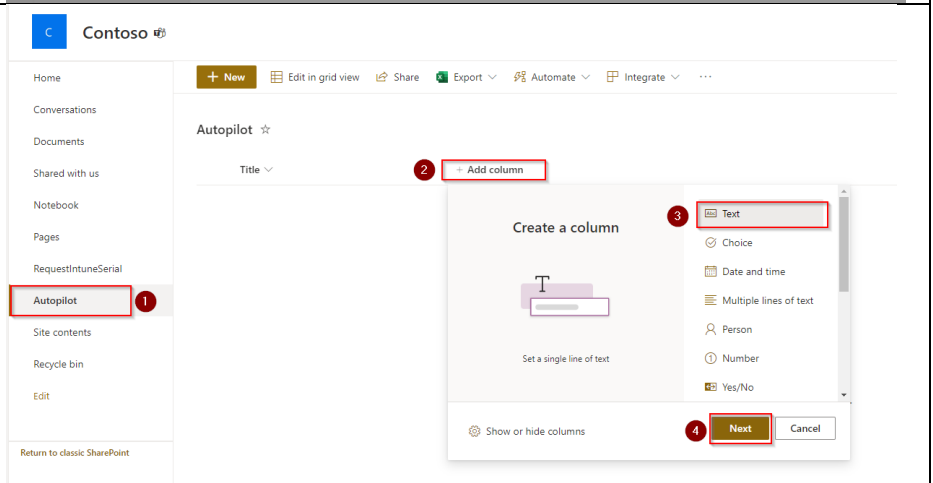

Your List is now ready to be used.

Create a List direct on SharePoint Site

Repeat the same process for the following columns you need to create (+ Add column):

- LocationCode
- DateTime
- Serial
- NewLocationCode

For each column give it a Name and Description and click SAVE (bottom of the TAB)

Create a column

[Learn more about column creation.](#)

Name *
LocationCode 1

Description
LocationCode 2

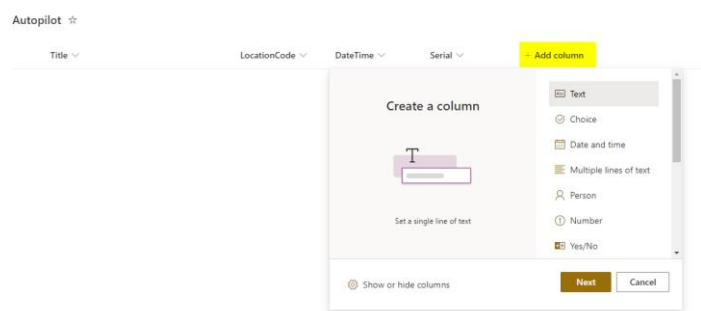

Type
Single line of text

Default value
Enter a default value

☐ Use calculated value

More options

For the next column (click again + add column)

List is now created

Copy Site URL and paste on line 31 on the script

```
30 #Uri
31 $siteUrl = "https://UPDATE-TO-YOUR-TENANTNAME.sharepoint.com/sites/Contoso" #please update to your TENANT NAME
```

Also update the List name at line 59 on the script

```
58 #upload values to SPT online list // List name: Autopilot (case sensitive)
59 Add-PnPListItem -List "Autopilot" -Values @{
```

Please follow this article to manipulate your List using PowerShell. (coming this week)

You can use a PowerShell function to achieve the same result in different scenarios.
